PART I — PLATFORM OVERVIEW

1. Executive Summary

The Anti-Fraud & Money Laundering System (AFML) is a unified transaction monitoring, screening and investigation platform designed to enable financial institutions to detect, prevent, investigate and report fraudulent, suspicious and high-risk financial activities across multiple banking and payment domains.

The platform provides comprehensive Fraud Monitoring, AML Transaction Monitoring and Sanctions & Watchlist Screening capabilities across Real-Time (RT), Near Real-Time (NRT) and Post-Transaction (PT) processing layers. AFML combines configurable rule-based detection, behavioral analytics, risk scoring, sanctions screening, operational orchestration and structured investigation workflows within a centralized and fully traceable operational ecosystem.

The solution is designed to support modern payment infrastructures and high-volume financial systems requiring real-time operational response, scalable processing, explainable decisioning and centralized governance controls.

AFML supports monitoring across:

- Account Payments
- Card Issuing
- Card Acquiring
- Online Banking Events (Web & Mobile)
- Internal User Activity Monitoring

The platform enables financial institutions to:

- reduce fraud losses and operational risks
- strengthen AML/CFT and sanctions compliance
- improve investigation efficiency and operational governance
- enhance explainability and auditability
- scale across high-volume and national payment infrastructures

AFML combines configurable no-code rule management, behavioral analytics, explainable scoring, sanctions screening, SLA-driven investigations, centralized operational governance and analytical visibility within a unified enterprise financial crime monitoring platform.

The platform is additionally designed to support:

- instant payment systems
- multi-rail transaction environments
- cross-channel monitoring

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

- national payment infrastructures
- scalable operational orchestration
- ecosystem-level risk visibility
- future evolution toward AI/ML-driven analytical capabilities

1.1 Version & Scope

Version: 1.0

Scope:

- ✓ Fraud Monitoring
- ✓ AML Transaction Monitoring
- ✓ Sanctions & Watchlist Screening
- ✓ Real-Time (RT), Near Real-Time (NRT), and Post-Transaction (PT) fraud monitoring
- ✓ Behavioral Analytics
- ✓ Alert & Case Management
- ✓ Investigation Workflow & Governance
- ✓ Rule Engine & Rule Lifecycle Management
- ✓ Transaction Search & Customer Profiling
- ✓ SLA & Queue Governance
- ✓ Regulatory Reporting Support
- ✓ Role-Based Access Control (RBAC)
- ✓ Audit & Traceability Framework
- ✓ Cross-Channel Correlation

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

2. Business Challenges & Market Context

Financial institutions are operating in an increasingly complex environment driven by digital transformation, instant payment systems, embedded finance, increasing regulatory pressure and continuously evolving fraud and AML typologies.

The acceleration of transaction volumes significantly increases exposure to:

- fraud risks
- money laundering risks
- terrorist financing risks
- sanctions violations
- mule account activity
- account/card takeover attacks
- merchant abuse
- insider threats
- cross-channel fraud schemes

At the same time, institutions must maintain:

- operational efficiency
- investigation consistency
- governance transparency
- auditability
- explainable decision-making
- real-time operational response capabilities
- scalable operational governance

Key Challenges

- High alert volumes leading to investigator overload and operational inefficiencies
- Fragmented monitoring systems limiting end-to-end customer risk visibility
- Cross-channel visibility limitations
- Increasing sophistication of fraud schemes requiring continuous rule optimization
- Large sanctions screening false-positive volumes impacting operational efficiency
- Inefficient investigation workflows impacting resolution timelines
- Lack of centralized traceability across detection, decision and investigation processes
- Real-time monitoring and operational orchestration requirements

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

- Multi-rail payment interoperability complexity
- Scalability requirements for instant payment and national payment infrastructures
- Governance, auditability and regulatory transparency requirements
- Increasing demand for explainable real-time decisioning and operational accountability

AFML addresses these challenges through a centralized, scalable and fully traceable enterprise monitoring architecture designed to support operational efficiency, governance transparency and real-time financial crime monitoring across multiple banking and payment domains.

3. Solution Overview

AFML is designed as a modular and scalable platform built on the principle of Lifecycle traceability, ensuring that every transaction, event, alert, screening result, investigation action and workflow transition is fully auditable and operationally trackable.

Supported Monitoring Domains

Account Payments

- Fraud Monitoring
- AML Monitoring
- Sanctions Screening
- Instant Payments Monitoring
- Cross-border Monitoring

Card Issuing

- Card Fraud Monitoring
- Card AML Monitoring
- Sanctions Screening
- Tokenized Payment Monitoring
- Cross-Channel (POS/ATM/E-Commerce) Fraud Monitoring
- ISO 8583 Card Transaction Monitoring

Card Acquiring

- Merchant Fraud Monitoring
- Merchant AML Monitoring
- Merchant Sanctions Screening
- Settlement Monitoring
- Cross-Channel (POS/ E-Commerce) Fraud Monitoring

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

- Merchant Behavioral Analytics

Online Banking

- Web Events Monitoring
- Mobile Banking Events Monitoring
- Account Takeover Detection
- Behavioral Analytics
- Device & Session Intelligence
- Digital Channel Risk Monitoring

Internal User Activity

- Insider Fraud Detection
- Privileged Access Monitoring
- Segregation of Duties Control
- Operational Governance Monitoring
- Internal Investigation Traceability

Core Components

The AFML platform includes:

- Data Ingestion Layer
- Rule Engine & Logic Configuration Framework
- Sanctions & Watchlist Screening Engine
- Risk Scoring & Explainable Decisioning Framework
- Configuration & RBAC Layer
- Alert Generation & Queue Management
- Investigation Workflow & Governance Framework
- Case Management Module
- Transaction Search & Investigation Interface
- Real-Time Operational Orchestration Layer
- Cross-Channel Correlation Capabilities
- Audit & Operational Traceability Framework

Business Flows

Real-Time (RT)

Real-Time (RT) monitoring supports immediate decisioning with card & instant payment handling during transaction processing.

Near Real-Time (NRT)

Near Real-Time (NRT) monitoring supports pre-processing detection with alert generation prior to transaction completion. The platform enables advanced analytics, additional

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

behavioral scoring, enhanced detection logic, aggregation analysis and pre-completion escalation capabilities across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

Post-Transaction (PT)

Post-Transaction (PT) monitoring supports retrospective monitoring, analytical investigation and pattern detection after transaction/payment execution. The platform enables AML analytics, behavioral investigations, historical aggregations, relationship analysis and analytical visibility across multiple monitoring domains and transaction/ payment channels.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

PART II — PRODUCT DOMAINS

1. Account Payments Monitoring

The Account Payments domain supports Fraud Monitoring, AML Monitoring and Sanctions Screening across instant payments, domestic transfers, international payments, correspondent banking flows and modern payment infrastructures supporting SWIFT messaging and ISO 20022 payment standards.

The domain is designed to support high-volume transaction environments requiring real-time operational response, behavioral analytics and scalable monitoring orchestration across multiple payment rails and transaction channels.

1.1 Fraud Monitoring Capabilities

Supported fraud monitoring scenarios include:

- velocity monitoring
- suspicious beneficiary activity
- mule account detection
- unusual transaction behavior
- rapid movement of funds
- high-risk geography activity
- cross-border transaction anomalies
- suspicious payment activity potentially associated with account takeover
- transaction pattern deviations
- rapid beneficiary changes

The platform supports behavioral analysis, historical transaction correlation, aggregation-based monitoring and real-time operational orchestration across account payment ecosystems.

1.2 AML Monitoring Capabilities

Supported AML monitoring scenarios include:

- structuring detection
- circular fund flow analysis
- rapid pass-through behavior
- dormant account activation

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

- layering indicators
- high-risk jurisdiction exposure
- unusual transaction movement patterns
- counterparty relationship anomalies
- behavioral deviations from expected customer activity

The platform supports retrospective analytics, historical behavioral analysis, aggregation monitoring and relationship-based analytical visibility across account payment activities.

1.3 Sanctions Screening

The platform supports:

- real-time transaction screening
- beneficiary and counterparty screening
- SWIFT payment screening
- fuzzy matching
- transliteration matching
- alias matching

The sanctions framework supports explainable screening results, operational traceability and configurable screening workflows aligned with institutional governance requirements.

1.4 Ecosystem Support

The Account Payments domain supports:

- instant payment ecosystems
- Real-Time payments infrastructures
- national payment switches
- multi-tenant transaction environments
- ISO 20022 payment infrastructures
- SWIFT messaging ecosystems

The architecture is designed to support cross-channel monitoring, analytical visibility, scalable operational orchestration and cross-participant monitoring capabilities.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

2. Card Issuing Monitoring

The Card Issuing domain supports Fraud Monitoring, AML Monitoring and Sanctions Screening across card authorization environments, ATM transactions, POS transactions, e-commerce payments, digital wallet ecosystems and tokenized payment infrastructures.

2.1 Fraud Monitoring Capabilities

Supported fraud monitoring scenarios include:

- card-not-present (CNP) fraud
- velocity attacks
- BIN attacks
- suspicious ATM cash withdrawals
- unusual card usage behavior
- compromised card activity
- abnormal geographic usage patterns
- cross-border transaction anomalies
- rapid transaction velocity
- suspicious card activity associated with account takeover
- digital wallet abuse
- tokenized payment anomalies
- merchant usage deviations
- abnormal authorization behavior

The platform supports real-time risk scoring, behavioral analysis, transaction aggregation monitoring and operational orchestration across issuing ecosystems.

2.2 AML Monitoring Capabilities

Supported AML monitoring scenarios include:

- suspicious cross-border spending behavior
- rapid movement of funds through card usage
- high-risk geography activity
- unusual spending aggregation patterns
- suspicious card usage concentration
- anomalous transaction distribution patterns

The platform supports historical analysis, behavioral monitoring and aggregation-based AML analytics across card payment activities

.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

2.3 Sanctions Screening

The platform supports:

- real-time card transaction screening
- merchant screening
- sanctions geography monitoring
- fuzzy matching
- transliteration matching
- alias matching

The sanctions framework supports explainable screening visibility and operational traceability across card payment environments.

2.4 Ecosystem Support

The Card Issuing domain supports:

- card authorization ecosystems
- ISO 8583-based card transaction environments
- tokenized payment infrastructures
- digital wallet ecosystems
- ATM, POS and E-Commerce transaction environments
- modern card processing infrastructures

The architecture is designed to support cross-channel monitoring, device intelligence integration, scalable authorization monitoring and multi-rail interoperability.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

3. Card Acquiring Monitoring

The Card Acquiring domain supports Fraud Monitoring, AML Monitoring and Sanctions Screening across merchant activity, acquiring transactions, settlement environments, payment gateways, e-commerce acquiring infrastructures and merchant onboarding processes.

3.1 Fraud Monitoring Capabilities

Supported fraud monitoring scenarios include:

- merchant collusion
- excessive refund activity
- transaction laundering indicators
- unusual merchant transaction behavior
- rapid turnover anomalies
- high-risk merchant activity
- cross-border merchant anomalies
- merchant behavioral deviations
- excessive reversal activity
- abnormal authorization concentration

The platform supports behavioral analytics, merchant aggregation monitoring and transaction pattern analysis across acquiring ecosystems.

3.2 AML Monitoring Capabilities

Supported AML monitoring scenarios include:

- suspicious merchant turnover
- funnel merchant activity
- layering indicators
- high-risk merchant geographies
- suspicious transaction aggregation patterns
- merchant behavioral anomalies

The platform supports historical analytical visibility, aggregation-based monitoring and relationship analysis across merchant ecosystems.

3.3 Sanctions Screening

The platform supports:

- Cardholder screening
- sanctions geography monitoring
- fuzzy matching
- transliteration matching

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

- alias matching

The sanctions framework supports explainable screening visibility and operational governance during transaction monitoring processes.

3.4 Ecosystem Support

The Card Acquiring domain supports:

- acquiring ecosystems
- payment gateway infrastructures
- merchant processing environments
- digital commerce ecosystems
- e-commerce transaction environments
- settlement and acquiring processing infrastructures

The architecture is designed to support cross-participant monitoring capabilities, ecosystem-level visibility and scalable multi-rail transaction monitoring.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

4. Online Banking Monitoring

The Online Banking domain supports Fraud Monitoring, AML Monitoring and Sanctions Screening across web banking, mobile banking, authentication events, digital sessions and online payment initiation events.

The domain is designed to support digital channel risk monitoring, behavioral analytics, device intelligence and operational visibility across modern digital banking ecosystems.

4.1 Fraud Monitoring Capabilities

Supported fraud monitoring scenarios include:

- account takeover detection
- credential stuffing
- session hijacking
- suspicious login behavior
- geolocation pattern monitoring
- abnormal device usage
- suspicious beneficiary activity
- unusual transaction behavior
- device fingerprint anomalies
- abnormal authentication behavior
- digital behavioral deviations

The platform supports behavioral analytics, device intelligence integration, session correlation and real-time operational orchestration across digital banking environments.

4.2 Ecosystem Support

The Online Banking domain supports:

- web banking ecosystems
- mobile banking ecosystems
- digital platforms

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

5. Internal User Activity Monitoring

The Internal User Activity domain supports Fraud Monitoring and operational governance monitoring across privileged users, operational administrators, AML investigators, fraud analysts and internal banking systems.

The domain is designed to support operational accountability, governance transparency, segregation of duties controls and centralized operational traceability across enterprise financial crime operations.

5.1 Fraud Monitoring Capabilities

Supported monitoring scenarios include:

- unauthorized access attempts
- privileged abuse
- suspicious customer data access
- unauthorized transaction approvals
- unusual operational behavior
- segregation of duties violations
- suspicious configuration changes
- abnormal internal activity patterns

The platform supports operational traceability, user behavior analysis and governance monitoring across internal operational environments

.

5.2 Ecosystem Support

The Internal User Activity domain supports:

- enterprise operational environments
- governance monitoring infrastructures
- operational audit environments

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

PART III — Key Features & Capabilities

1. Rule Engine & Logic Configuration

The Rule Engine represents the core monitoring and decisioning layer of the platform, enabling fraud and compliance teams to define, manage and deploy detection strategies without reliance on software development.

The engine provides a no-code visual logic builder that allows analysts to construct complex monitoring and detection scenarios using structured “If–Then” logic with multiple conditions. Rules can combine transaction attributes, customer characteristics, counterparty information, behavioral indicators and historical aggregations to identify anomalies such as velocity breaches, unusual transaction behavior, suspicious activity patterns and risk-based threshold violations.

The platform supports configurable fraud rules, AML rules, sanctions rules and behavioral monitoring rules across multiple product domains and transaction channels.

The engine supports advanced mathematical and aggregation functions for dynamic scoring, as well as historical analysis, behavioral comparisons and cross-channel activity correlation. Full rule lifecycle management is available, including versioning, approval workflows, dynamic rule deployment, activation and deactivation, ensuring governance, explainability and auditability.

2. Behavioral Analytics

Supports customer behavior profiling, anomaly detection, transaction behavior analysis, device and session behavior analysis, cross-channel activity correlation and identification of unusual behavioral patterns across customers, transactions, devices and payment systems. The platform enables detection of deviations from established behavioral baselines to support enhanced fraud detection, AML monitoring and risk-based investigation processes.

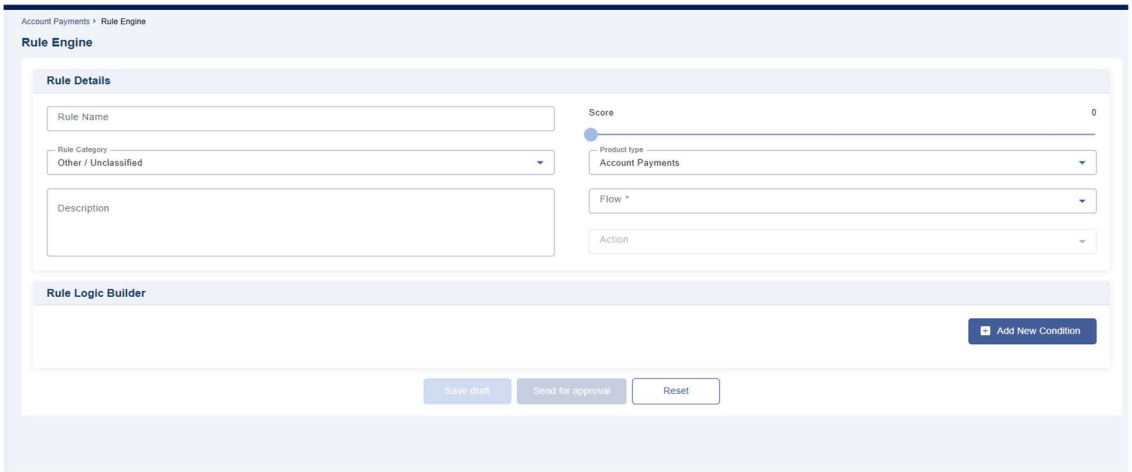

3. Risk Scoring Engine

The Risk Scoring Engine converts triggered rules, behavioral indicators and screening matches into quantifiable risk values, enabling consistent prioritization, operational orchestration and decision-making across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

Any rule or screening scenario can be assigned with a predefined score. When multiple rules or screening matches are triggered, their scores can be aggregated to produce a total alert risk score. This ensures transparency and allows investigators to understand how risk is derived.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

Configurable risk thresholds can determine classifications into High, Medium and Low-risk categories, which directly influence alert prioritization, queue routing, escalation workflows and investigation handling.

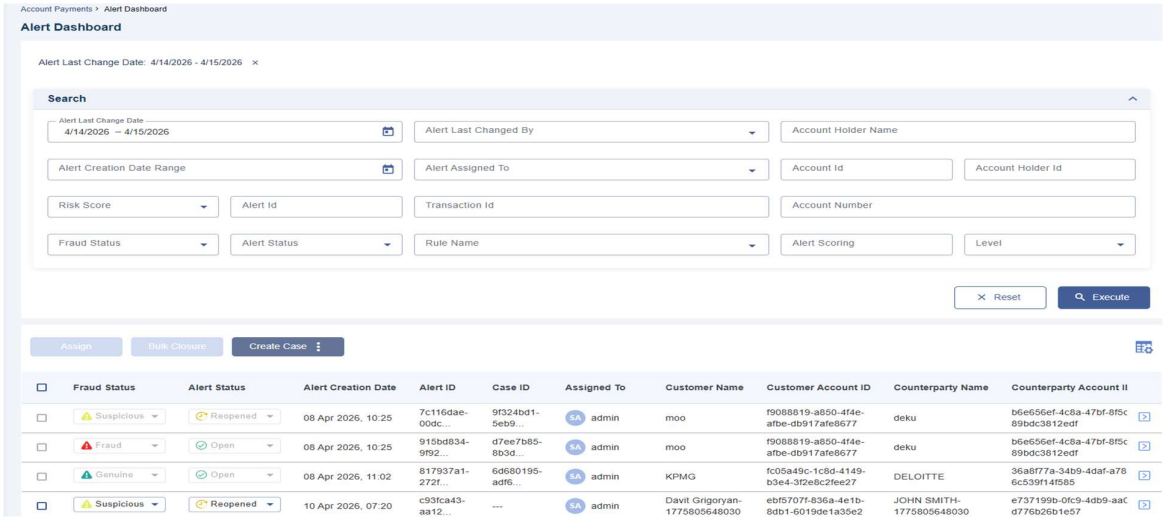

4. Alert Management

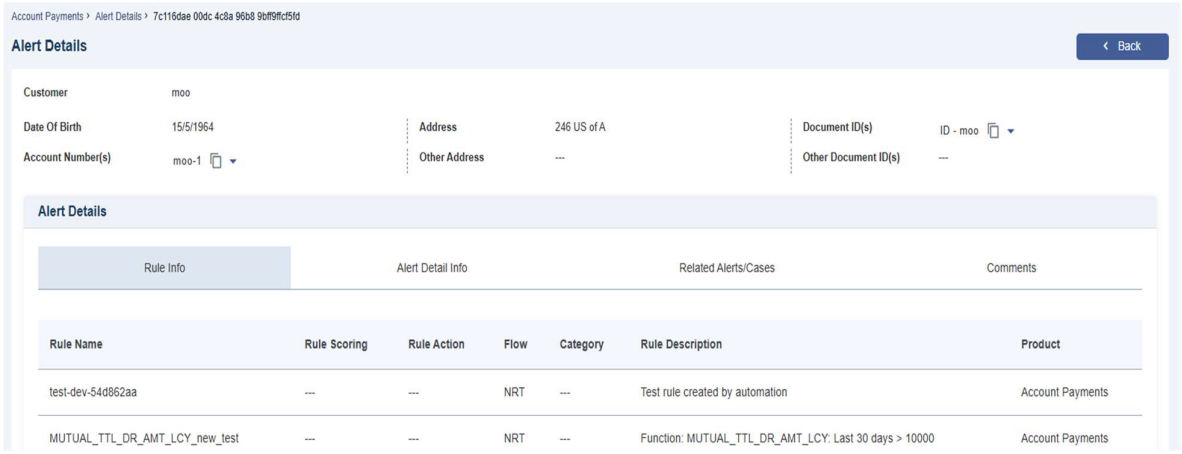

The Alert Dashboard serves as the operational control center for Fraud Monitoring, AML Monitoring and Sanctions Screening teams. It transforms large volumes of system-generated alerts into structured and prioritized operational queues based on risk level, SLA urgency, screening confidence and configurable business criteria.

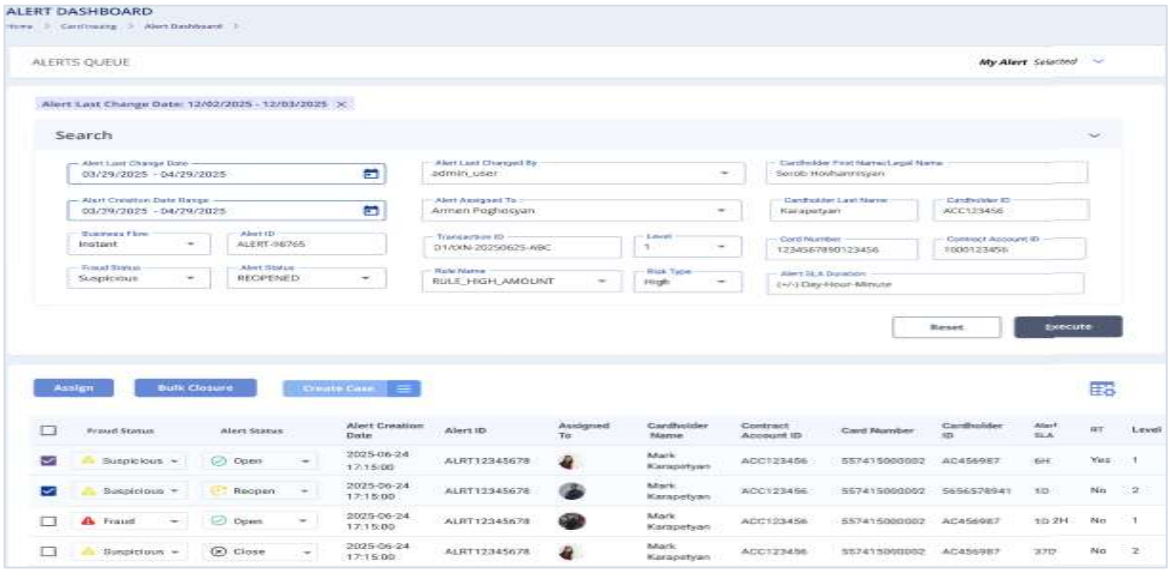

Investigators and analysts can efficiently manage alerts using advanced filtering, assignment and search mechanisms. The system enforces single ownership of alerts, ensuring accountability, operational traceability and role-based processing across investigation workflows.

Bulk operations, including alert assignment, closure and case creation, support efficient handling of alerts during high-volume operational scenarios, while SLA-driven prioritization ensures that critical alerts are addressed within defined operational timeframes.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

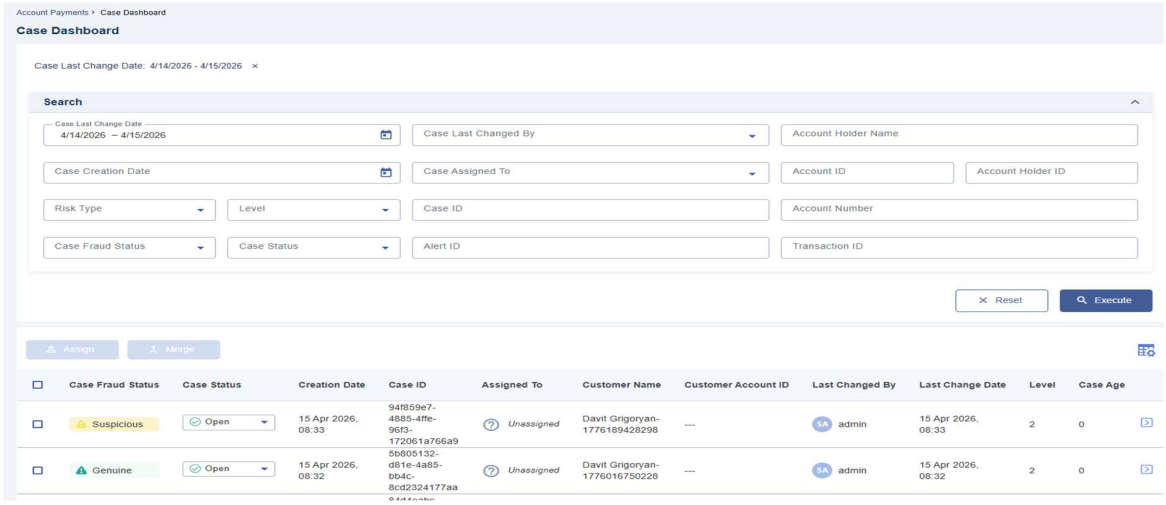

5. Case Management

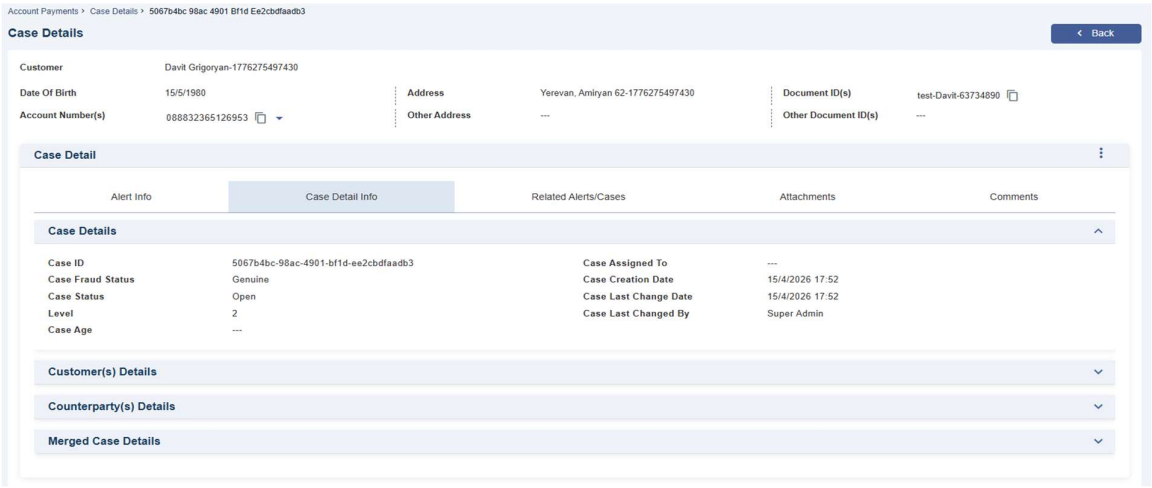

The Case Management module enables investigators and analysts to group related alerts into a unified investigation entity, providing broader visibility into potentially fraudulent, suspicious or sanctions-related activity across multiple transaction channels.

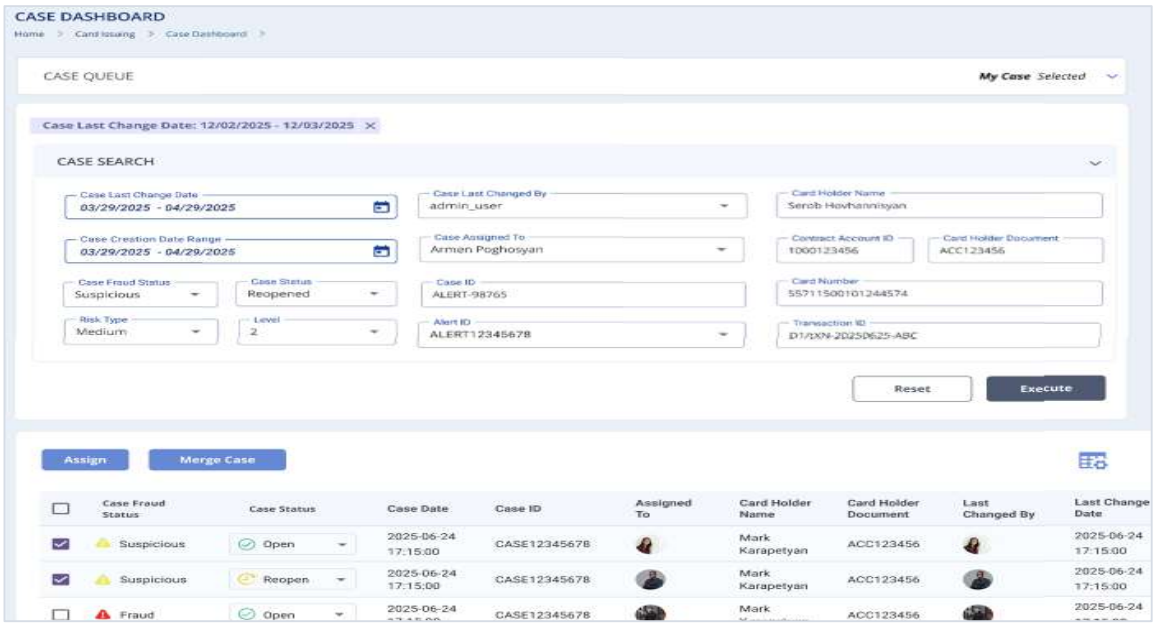

Cases support a full lifecycle, including creation, investigation, escalation and closure. Features such as case merging, document attachment, evidence management and structured commentary enable collaborative investigation workflows while maintaining governance transparency and audit readiness.

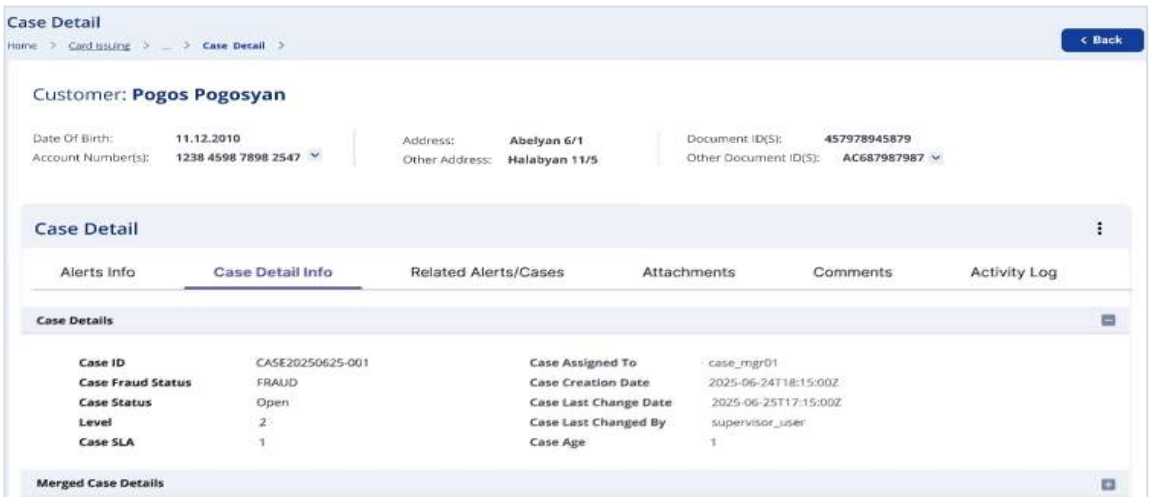

This approach allows institutions to move beyond isolated alert handling toward context-driven fraud, AML and sanctions investigations with centralized operational traceability and investigation governance.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

6. Investigation Workflow & Governance

The Investigation Workflow & Governance framework provides centralized operational control across Fraud Monitoring, AML Monitoring and Sanctions Screening investigation processes. The framework is designed to ensure consistent investigation handling, operational accountability, governance transparency and end-to-end traceability across the full alert and case lifecycle.

The platform supports structured alert-to-case investigation workflows, enabling institutions to manage the complete operational lifecycle from alert generation and queuing through investigation, escalation, regulatory review and final decisioning.

Investigation workflows support configurable operational queuing, assignment governance, escalation management and SLA-driven prioritization across multiple monitoring domains, transaction channels and operational teams.

The framework enables controlled investigation ownership and operational accountability through role-based assignment management, workload distribution and segregation of duties controls. Alert and case activities are fully traceable, ensuring transparency of investigation actions, workflow transitions, escalations and operational decisions.

AFML supports centralized investigation orchestration capabilities including:

- alert-to-case lifecycle management
- queue-based operational routing
- investigation assignment governance
- escalation workflows
- SLA-driven operational prioritization
- segregation of duties enforcement
- investigation accountability tracking
- compliance escalation processes
- operational traceability and auditability
- centralized investigation governance

The platform additionally supports multi-level investigation workflows across operational, supervisory and compliance/governance teams, enabling structured collaboration and controlled escalation handling for high-risk alerts and cases.

Comprehensive operational traceability is maintained across all workflow stages, including alert handling, case creation, assignment changes, escalation actions, investigation decisions and workflow status transitions. This ensures governance transparency, audit readiness and investigation consistency across enterprise financial crime operations.

The Investigation Workflow & Governance framework strengthens operational discipline, improves investigation consistency, supports regulatory expectations and enhances

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

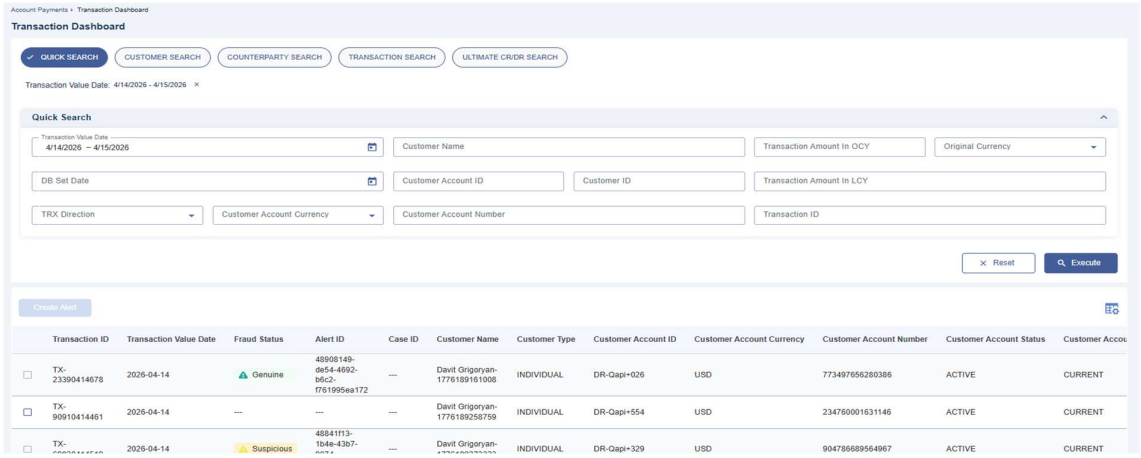

enterprise-level governance maturity across Fraud Monitoring, AML Monitoring and Sanctions Screening environments.

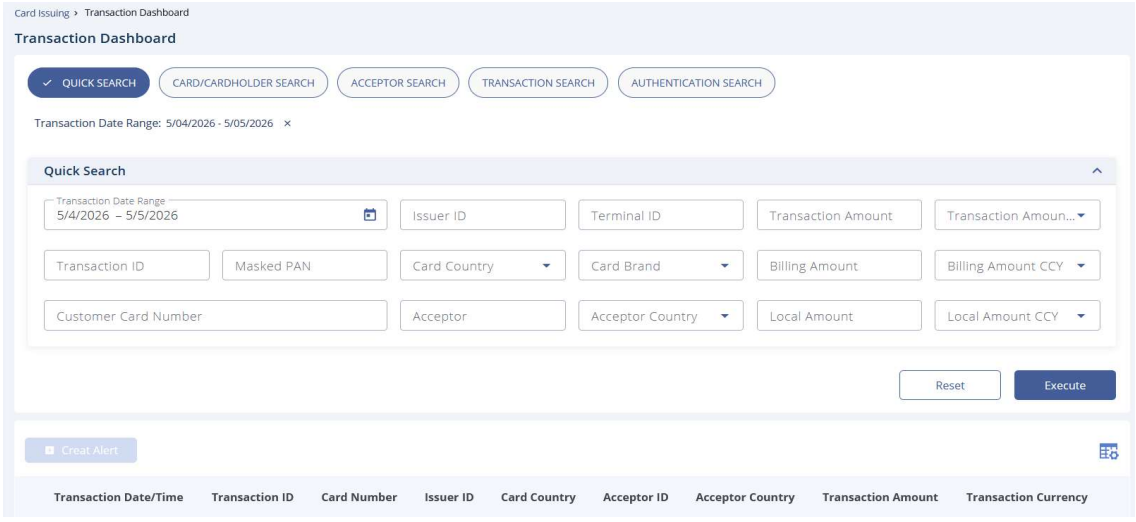

7. Transaction Search & Analysis

The Transaction Search module provides advanced analytical capabilities, enabling investigators and analysts to perform retrospective analysis across historical transaction, payment and event data.

Users can query transactions using multiple dimensions, including customer/cardholder identifiers, counterparties, transaction attributes, device indicators, screening results and time-based filters. This functionality supports the identification of hidden fraud patterns, suspicious activity indicators and behavioral anomalies while enhancing investigative depth across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

The module additionally supports cross-channel activity correlation, historical aggregation analysis, relationship analysis and ecosystem-level analytical visibility across multiple payment rails, transaction channels and monitoring domains.

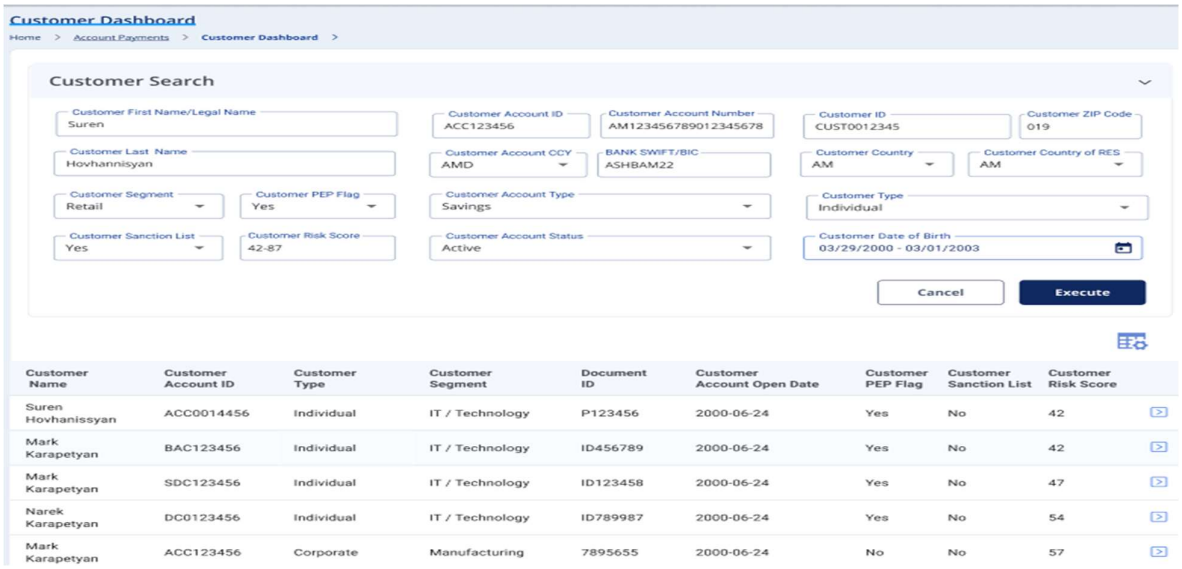

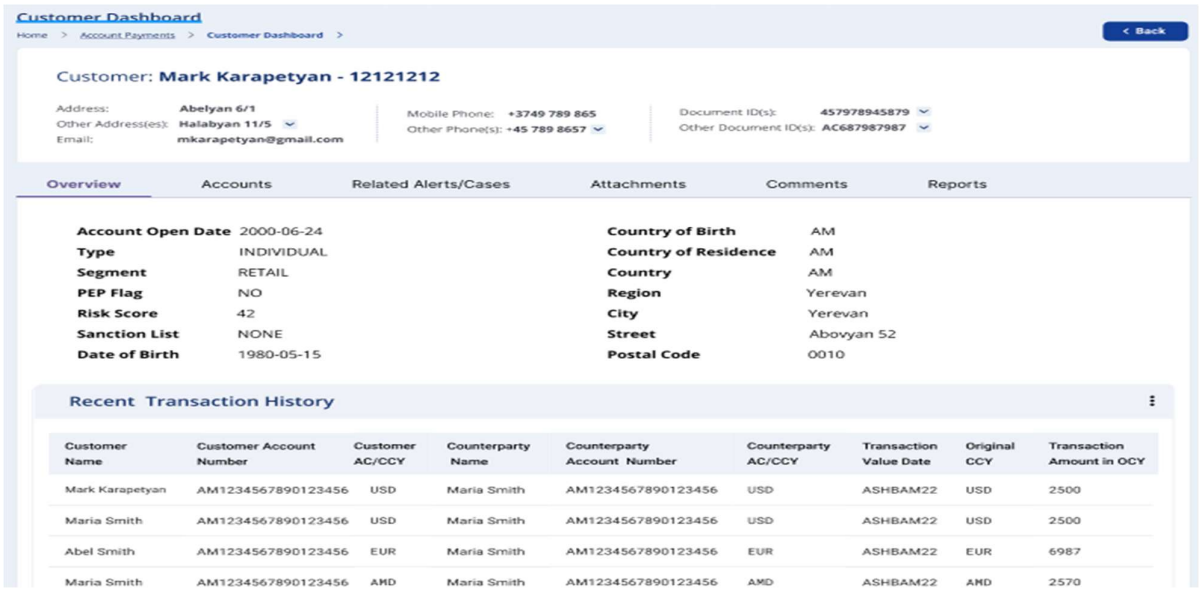

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

8. Customer Risk Profiling

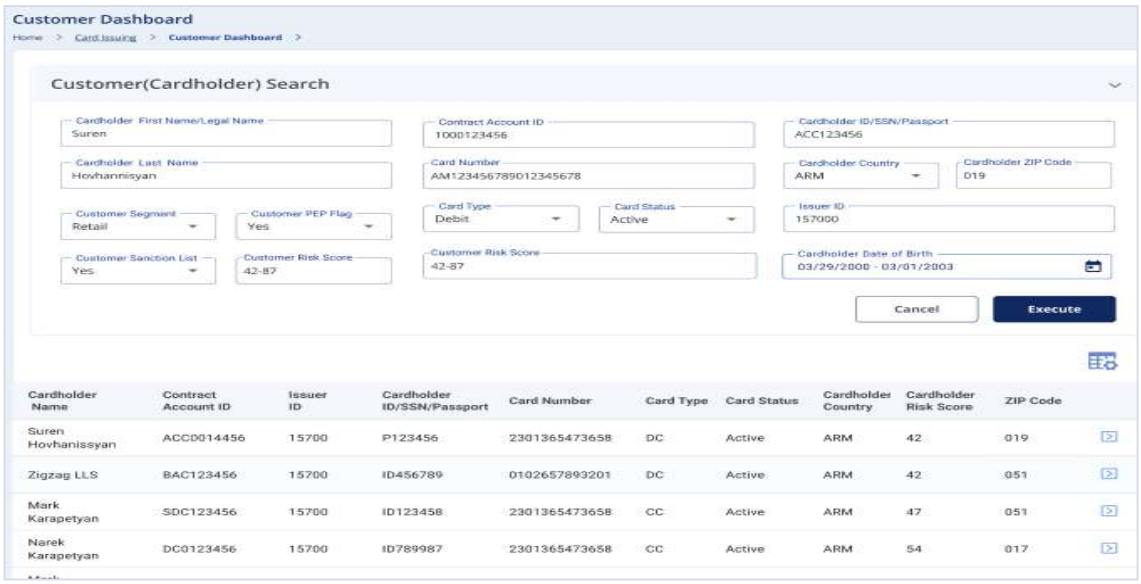

The Customer Dashboard provides a consolidated 360-degree view of customer information, including transactions, alerts, cases and risk attributes within a single interface.

This supports improved decision accuracy, enhanced customer protection, risk-based investigation processes and more effective identification of fraudulent, suspicious and high-risk customer behavior.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

9. SLA & Queue Management

The platform includes a configurable SLA and queue governance framework designed to ensure timely processing of alerts and cases in line with operational, compliance and governance requirements.

SLAs can be defined by Business Flow, Lifecycle Stage and Product Type configuration. It can be aligned with working calendars to ensure accurate time tracking, escalation management and investigation governance.

Queue management enables structured workload distribution, prioritization, escalation and operational routing across Fraud Monitoring, AML Monitoring and Sanctions Screening investigation teams.

The platform supports configurable SLAs, queue routing, escalation management, calendar-aware calculations and SLA-driven operational orchestration to ensure timely handling of high-risk alerts and cases across multiple monitoring domains and transaction channels.

10. Explainable Decisioning

AFML applies a fully explainable and auditable decisioning framework across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

Every rule trigger, score contribution, screening match, escalation decision and operational workflow transition is fully traceable and transparent, enabling investigators and analysts to clearly understand how risk scores, alerts and operational decisions are derived.

The explainability framework supports investigation transparency, operational governance, auditability and regulatory review requirements across multiple monitoring domains.

11. Activity Logging & Audit Trail

AFML maintains a comprehensive and immutable audit trail across all system modules and operational workflows.

All user and system actions are recorded, including data changes, user identification, timestamps, status transitions, rule lifecycle activities, investigation actions, operational escalations and workflow transitions. This ensures full transparency, operational governance, investigation traceability and audit readiness across Fraud Monitoring, AML Monitoring and Sanctions Screening processes.

The platform supports immutable audit trail management, user activity tracking, rule lifecycle traceability and centralized operational governance across multiple monitoring domains and transaction channels.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

12. Alert Scoring & Case Scoring Framework

The platform applies a deterministic and fully explainable scoring framework to ensure transparency, consistency and operational prioritization across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

Alert Score Calculation

Alert Score is calculated as the aggregated result of triggered rules, behavioral indicators and screening match contributions based on configurable scoring logic.

Primary Rule Selection

The highest scoring rule or monitoring scenario can be used as the primary decision driver and operational risk indicator.

Case Score Calculation

Case Score is calculated as the aggregation of all linked Alert Scores and is automatically recalculated when alerts are linked, unlinked or when cases are merged.

The scoring framework supports configurable risk thresholds, operational prioritization, explainable decisioning and investigation orchestration across multiple monitoring domains and transaction channels.

This scoring approach ensures explainability, supports investigation prioritization and provides a foundation for advanced analytical and behavioral scoring enhancements.

13. Role & User Management

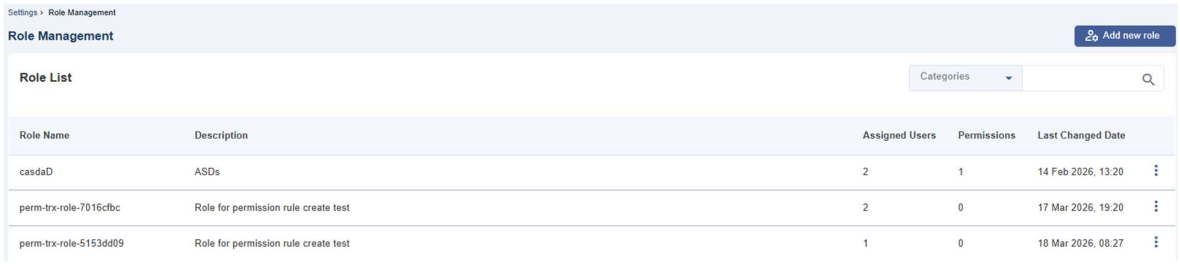

The platform enforces access management through a Role-Based Access Control (RBAC) framework, ensuring that users can only perform actions aligned with their operational responsibilities and governance permissions.

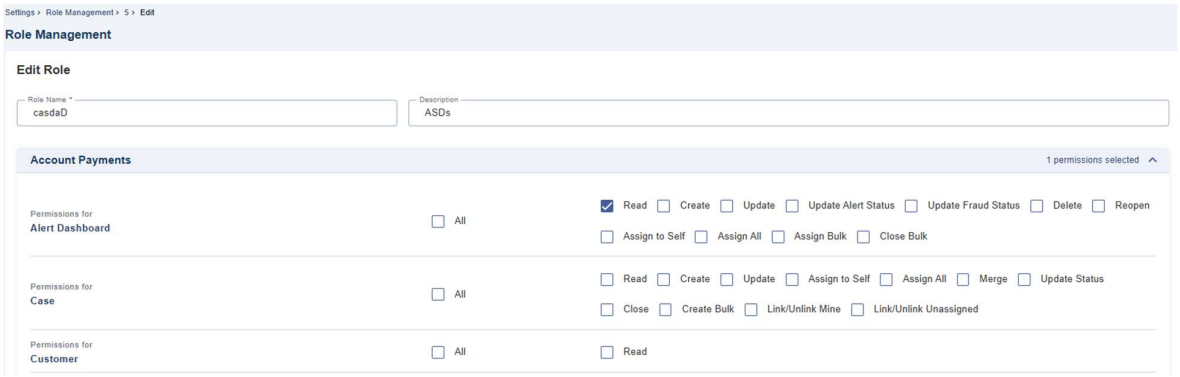

Permissions can be configured at module, workflow and action levels, supporting segregation of duties, investigation governance and operational control requirements across Fraud Monitoring, AML Monitoring and Sanctions Screening processes.

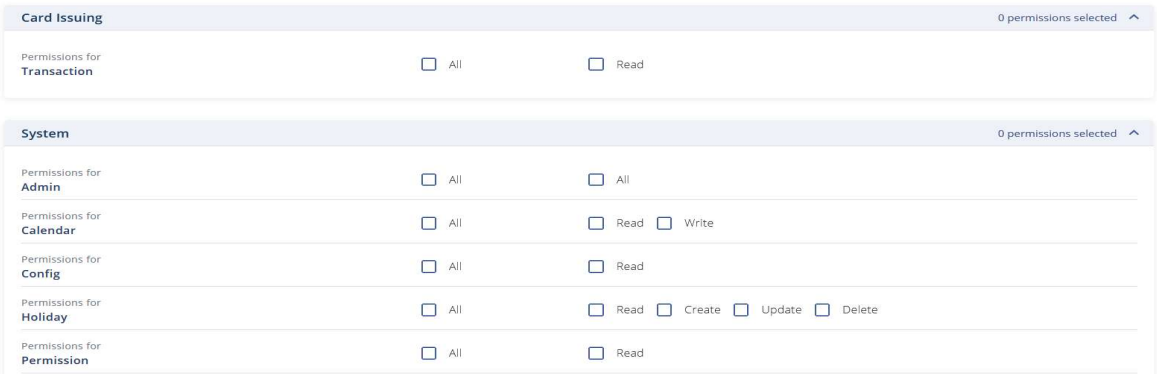

User management supports synchronization with external identity providers, audit tracking, flexible role assignment and centralized operational governance across multiple monitoring domains and investigation workflows.

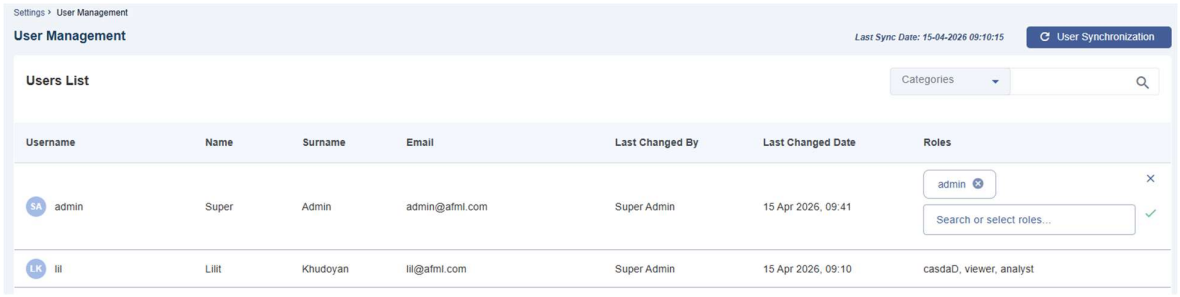

The platform additionally supports operational traceability, investigation accountability and controlled access management for sensitive monitoring and investigation activities.

PART IV — TECHNOLOGY & ARCHITECTURE

1. Technical Architecture & Integrations

AFML is designed using a modular and scalable architecture that supports high-volume transaction processing, real-time monitoring and flexible integration within existing banking and payment ecosystems. The solution follows an API-first architecture approach, enabling seamless connectivity with upstream and downstream systems while ensuring maintainability, extensibility and interoperability across multiple monitoring domains.

The architecture is designed to support modular component evolution, real-time operational orchestration and scalable deployment models for modern payment ecosystems and national payment infrastructures.

1.1 Architecture Principles

- Modular and scalable architecture enabling independent component evolution
- API-first integration approach for interoperability and flexibility
- Event-driven processing supporting real-time and near real-time detection
- Real-time operational processing support
- Scalable deployment architecture for high-volume payment ecosystems
- Distributed processing and operational resiliency support

1.2 Integration Capabilities

The system integrates with key banking, payment and operational systems, including:

- Core Banking Systems for transaction and customer data ingestion
- Payment gateways and transaction switching environments
- Payment systems supporting ISO 20022 messaging standards
- SWIFT messaging environments and correspondent banking ecosystems
- Identity and Access Management systems such as Keycloak, LDAP, Active Directory and external Identity Providers
- Sanctions and watchlist data providers
- Instant payment infrastructures and real-time payments ecosystems
- National payment switches
- Card authorization and switching environments
- ISO 8583-based card transaction environments
- Tokenization and digital wallet ecosystems

Sensitive financial and personal data is handled securely in accordance with deployment-specific security configurations, governance controls and data protection requirements.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

PART V — SECURITY, COMPLIANCE & SLA

AFML incorporates security, governance and operational control mechanisms designed to support secure operations, data protection, operational traceability and auditability across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

1. Security Features

The platform supports:

- Role-Based Access Control (RBAC) aligned with least privilege principles
- Secure API communication mechanisms
- Encrypted communication and data protection controls
- User activity tracking and operational traceability
- Governance controls for sensitive operational activities
- Centralized authentication and authorization management
- Secure operational access management

2. Compliance Support

The platform supports Fraud Risk Management, AML/CFT monitoring and investigation workflows, sanctions screening processes, and real-time, near-real time and post-transaction monitoring across multiple banking and payment domains.

AFML provides end-to-end investigation traceability, comprehensive audit trail management, ongoing customer and transaction screening, operational governance and compliance transparency across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

The solution supports centralized operational oversight through full traceability of alerts, cases, user activities, workflow transitions and investigation decisions, ensuring governance transparency, operational accountability and audit readiness.

The platform is designed to support alignment with:

- FATF recommendations
- AML/CFT regulatory frameworks
- Sanctions compliance obligations
- Internal governance standards
- Fraud prevention and operational risk management practices

Final compliance alignment depends on institution-specific configuration, implemented monitoring scenarios, operational procedures and applicable regulatory requirements.

3. SLA Framework

The SLA framework is designed to ensure timely processing, escalation and investigation of alerts and cases across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

SLAs can be configured based on Business Flow, Product Type and Lifecycle Stage configuration.

The system supports calendar-aware SLA calculations aligned with working hours, weekends and holidays, as well as SLA pause, resume and extension mechanisms to support operational flexibility, escalation management and investigation governance.

PART VI — IMPLEMENTATION & SUPPORT

AFML supports a structured implementation approach that allows financial institutions to progressively enable fraud monitoring capabilities based on operational readiness.

1. Implementation Approach

The platform can be deployed in phases, typically starting with real-time rule validation, followed by near real-time and post-transaction monitoring. Integration with existing banking systems is supported through configurable interfaces and standardized data exchange formats.

Onboarding is configurable and includes rule setup, queue configuration, role and SLA definition aligned with institutional policies.

2. Support

Support can consist of ongoing maintenance of services to ensure stable system operation, continuous performance optimization, and alignment with evolving business and regulatory requirements.

Support services may include:

✓ **System Monitoring and Operational Maintenance**

Continuous monitoring of system health, performance, and availability to ensure stable operations and timely identification of potential issues. Includes preventive maintenance and performance optimization activities.

✓ **Configuration Management and Change Support**

Support for ongoing configuration activities, including rule updates, SLA adjustments, queue configuration, and system parameter tuning, ensuring alignment with changing fraud patterns and business requirements.

✓ **Incident Management and Resolution**

Structured handling of incidents, including issue identification, root cause analysis, prioritization and resolution within defined service levels, ensuring minimal disruption to operations.

✓ **Release and Deployment Support**

Assistance with system updates, new feature deployments and controlled release management, ensuring smooth transition and minimal operational impact.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

✓ **User Support and Training**

Support for end-users and administrators, including guidance, troubleshooting assistance and training to ensure effective system utilization.

✓ **Service Level and Performance Management**

Monitoring and reporting of support performance against agreed service levels, ensuring transparency and continuous improvement of support services.

PART VII — REPORTING & AUDIT

AFML provides comprehensive reporting, analytics and audit capabilities designed to support operational monitoring, investigation transparency, regulatory reporting and governance requirements across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

The platform ensures that all operational activities, monitoring events, investigation workflows, configuration changes and user actions are traceable, reportable and available for operational oversight, compliance review, management reporting and external audit purposes.

The reporting framework is designed to support:

- operational monitoring
- analytical reporting
- regulatory reporting
- managerial visibility
- investigation transparency
- audit readiness
- governance oversight
- ecosystem-level analytical visibility

The platform supports configurable reporting, operational dashboards, export capabilities and centralized audit traceability across multiple monitoring domains and transaction channels.

1. Reporting

AFML supports configurable operational, analytical, managerial and regulatory reporting capabilities across Fraud Monitoring, AML Monitoring and Sanctions Screening domains.

The reporting framework is designed to support:

- operational investigation teams
- fraud operations
- AML and compliance teams
- supervisory users
- executive management
- internal audit functions
- regulatory reporting teams

1.1 Operational Reporting

The platform supports operational reporting capabilities including:

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

- Fraud KPI dashboards
- real-time transaction monitoring reports
- operational workload dashboards
- alert and case volume reporting
- false-positive monitoring
- alert turnaround visibility
- operational trend analysis

Operational reporting supports drill-down analytical visibility across customers, transactions, alerts, investigations and operational workflows.

1.2 Analytical Reporting

The platform supports analytical and behavioral reporting capabilities including:

- transaction behavior analysis
- customer segmentation reporting
- geography-based analysis
- product and channel analysis
- monitoring trend analysis
- suspicious activity reporting

The analytical framework supports operational intelligence, monitoring optimization and governance visibility across enterprise monitoring environments.

1.3 Regulatory Reporting

AFML supports regulatory reporting workflows and reporting visibility for:

- Suspicious Transaction Reports (STR)
- Mandatory Notification Reports (MNR)
- transaction reporting
- sanctions-related reporting

The reporting framework supports configurable reporting structures aligned with institutional operational models and regulatory requirements.

1.4 Audit & Governance Reporting

The platform supports centralized governance and audit reporting capabilities including:

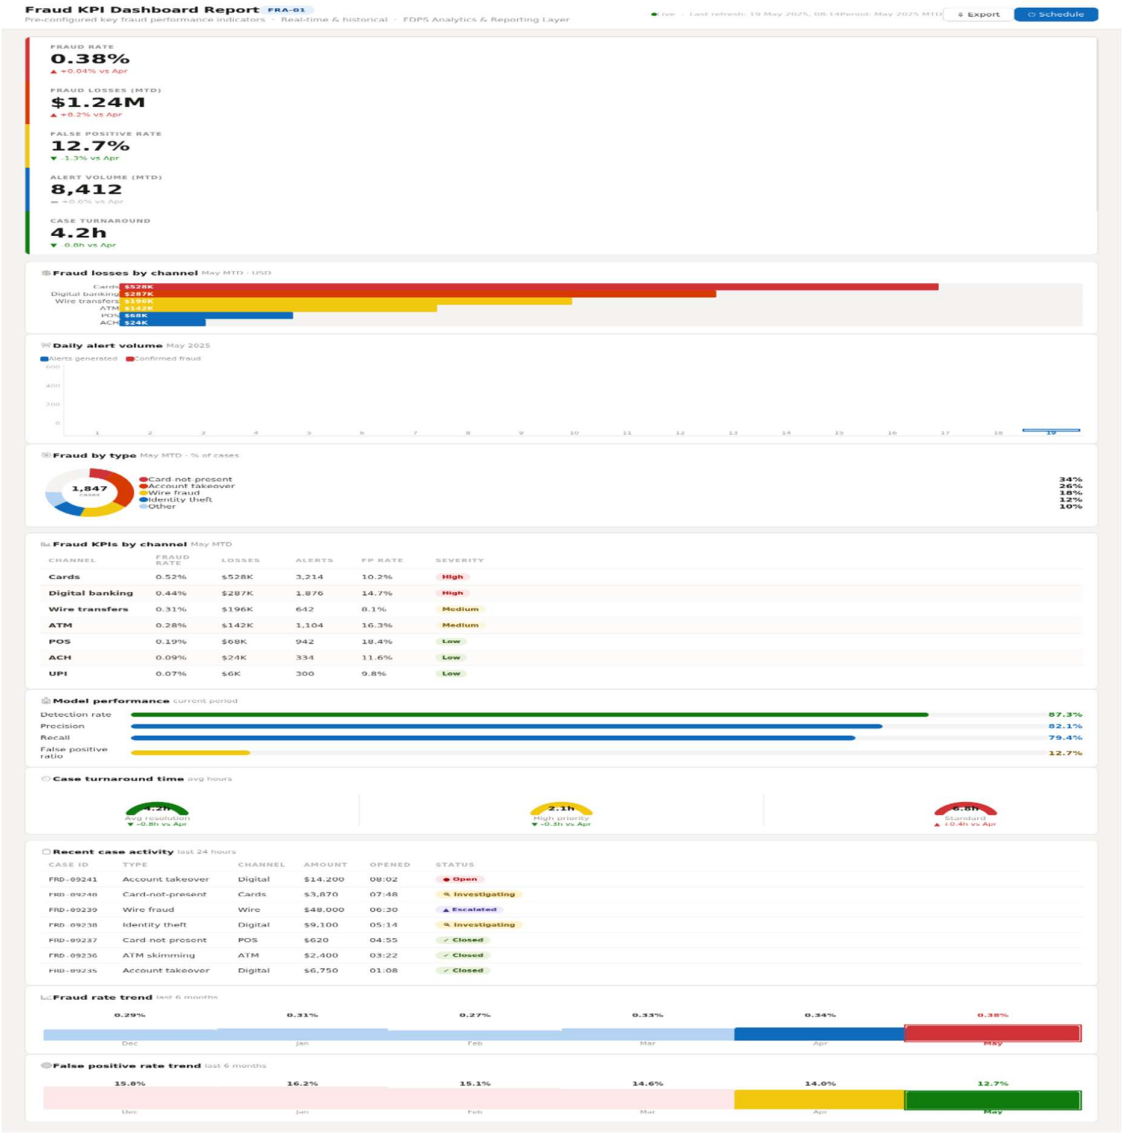

- user activity audit reports
- rule lifecycle audit reports

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

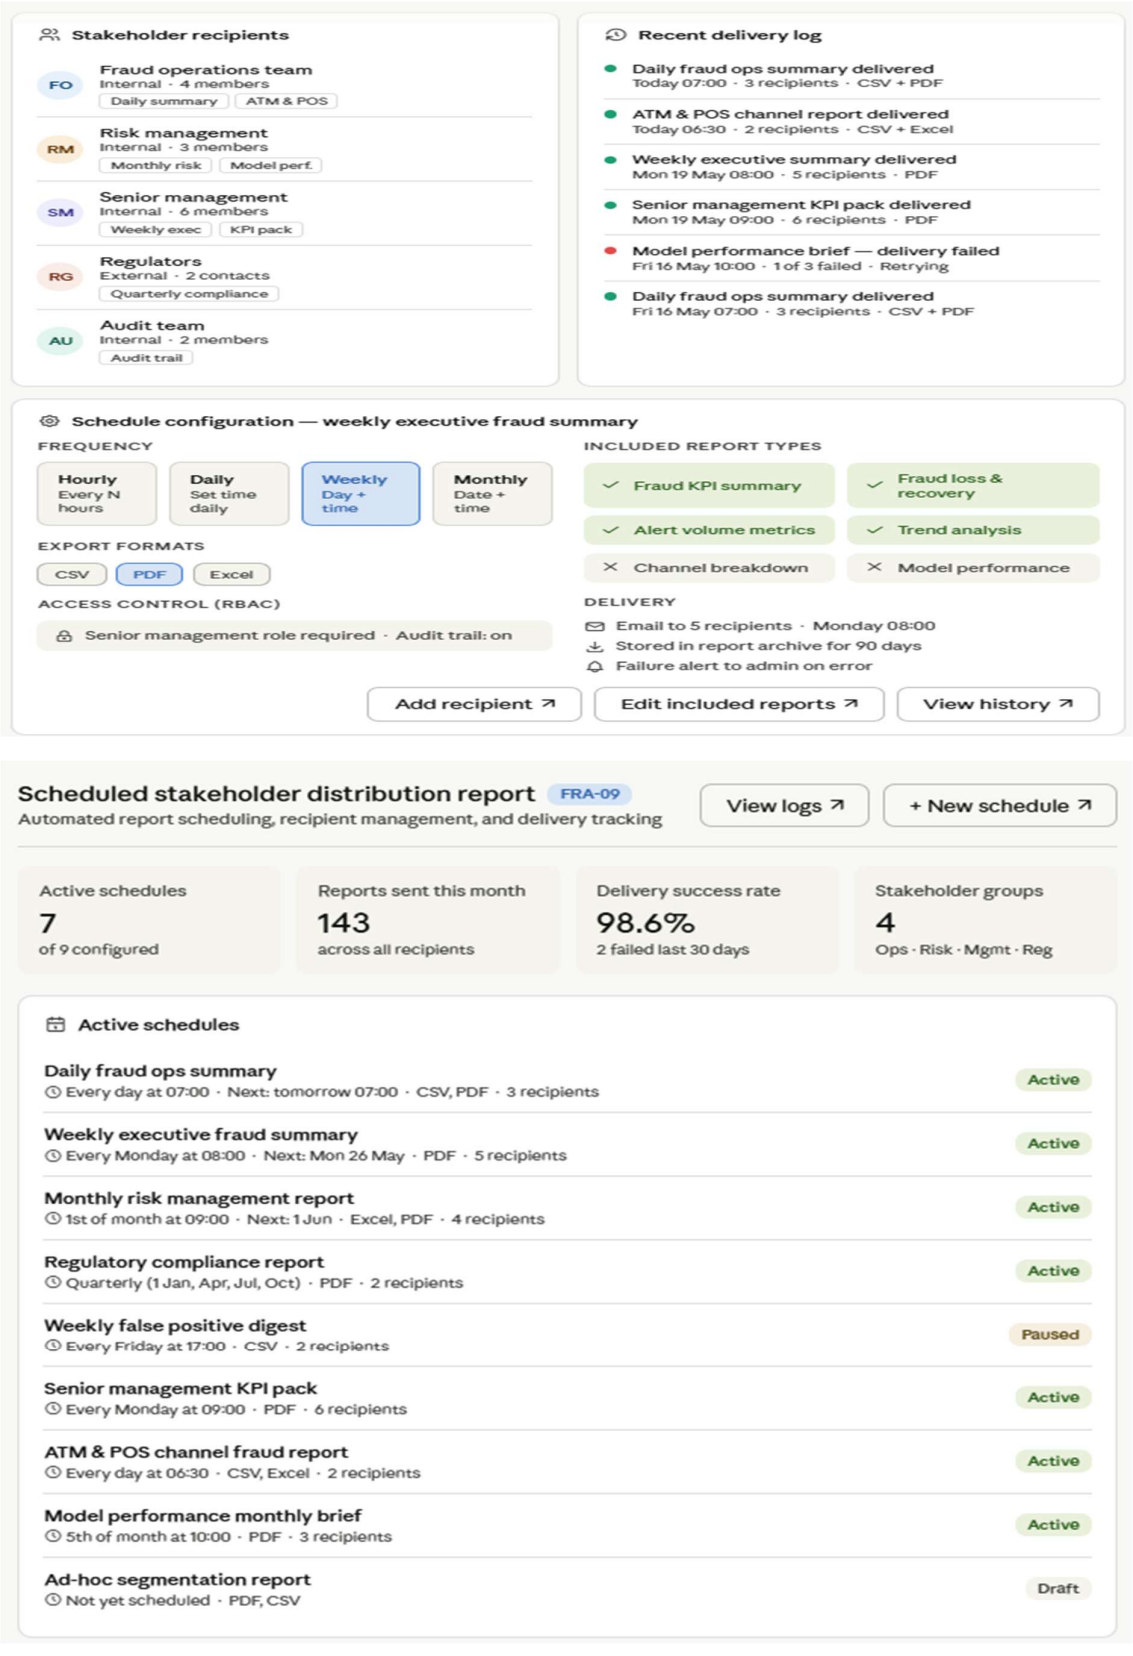

- configuration change reports
- operational escalation reports
- workflow transition reporting
- access monitoring reports

The audit framework supports governance transparency, operational accountability and enterprise-level audit readiness across financial crime monitoring operations.

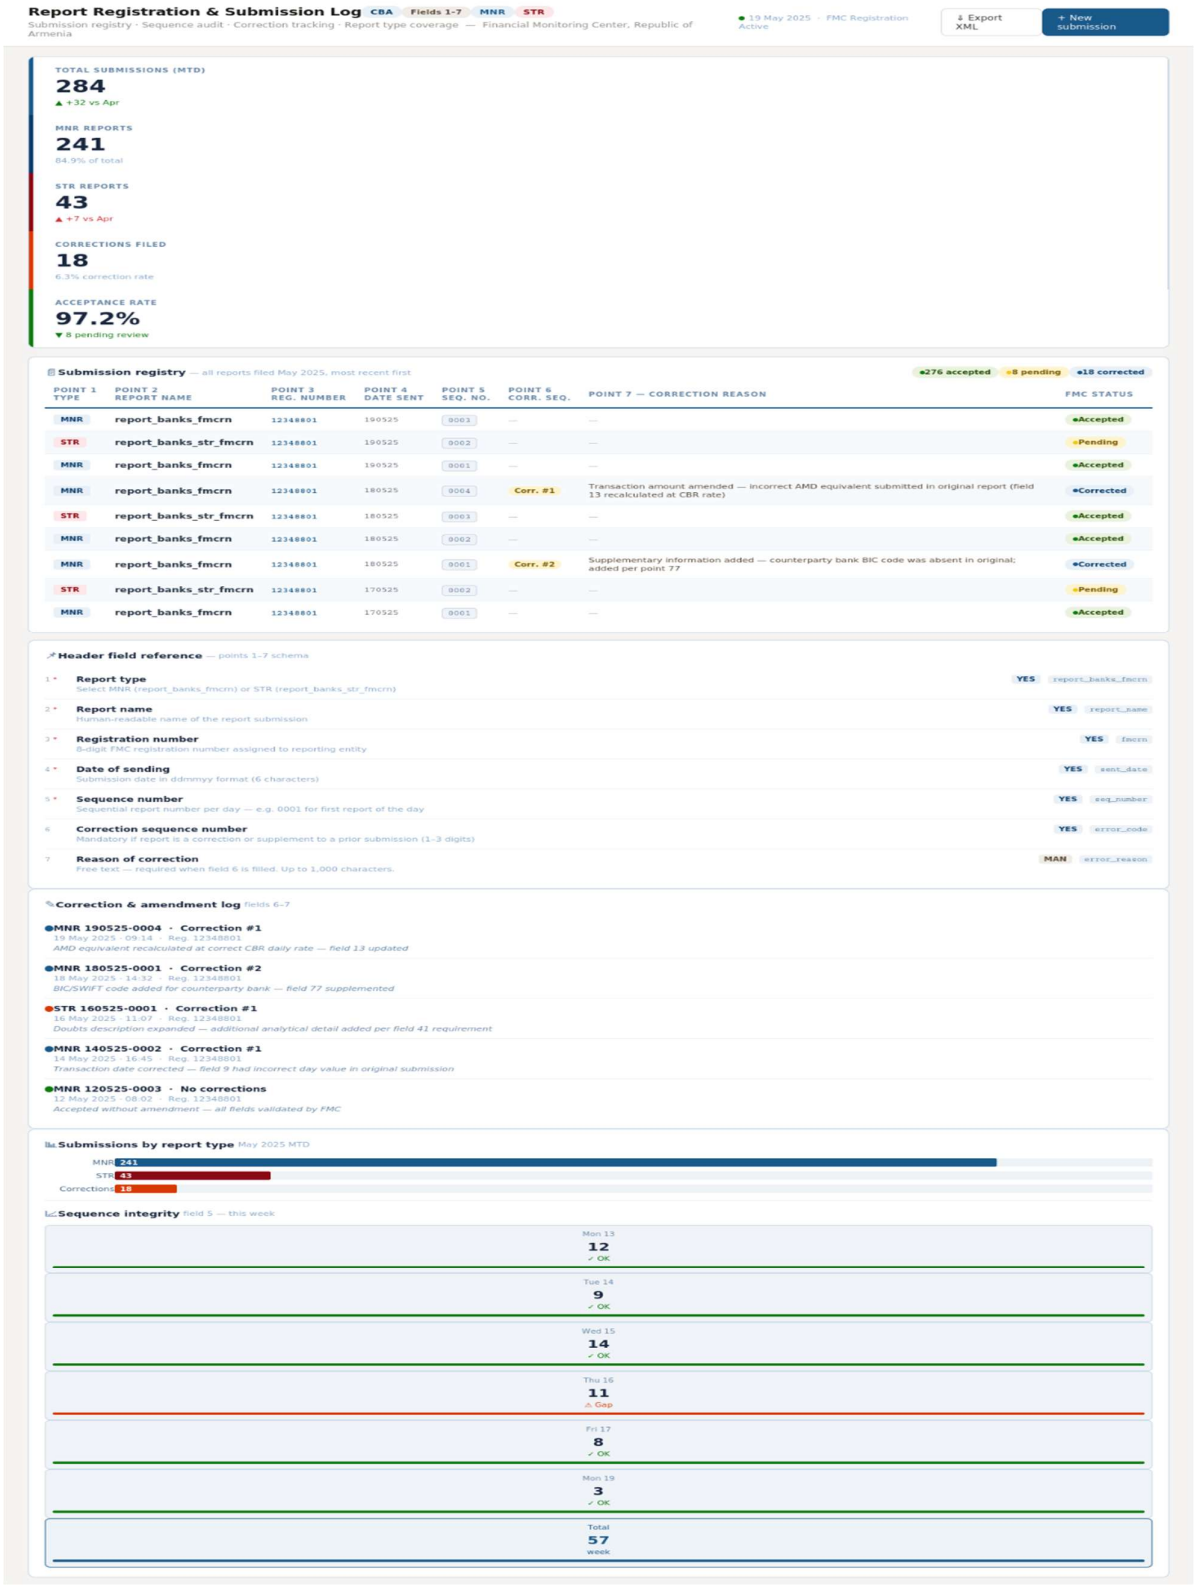

Below are presented some screenshots from Reporting Dashboard:

PART VIII — WHY CHOOSE AFML

AFML provides a unified, scalable and enterprise-grade financial crime monitoring platform designed to support Fraud Monitoring, AML Monitoring and Sanctions Screening operations across multiple banking and payment domains.

The platform combines configurable monitoring capabilities, behavioral analytics, operational orchestration and structured investigation workflows within a centralized and fully traceable operational ecosystem.

AFML is designed to support:

- operational efficiency
- governance transparency
- explainable decisioning
- scalable monitoring operations
- centralized investigation management
- real-time operational response
- enterprise-grade auditability
- ecosystem-level analytical visibility

The solution enables institutions to adapt rapidly to evolving fraud, AML and sanctions typologies while maintaining operational control, investigation consistency and governance transparency across enterprise financial crime operations.

1. Key Differentiators

1.1 Real-Time Operational Monitoring & Orchestration

Supports real-time transaction monitoring, risk evaluation, operational orchestration and decisioning across instant payment ecosystems, digital banking channels and modern payment infrastructures.

The platform enables:

- transaction blocking advice
- sanctions blocking advice
- operational escalation routing
- workflow orchestration
- real-time risk scoring
- rapid operational response

across high-volume transaction environments.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

1.2 Unified Fraud, AML & Sanctions Monitoring Platform

AFML consolidates Fraud Monitoring, AML Monitoring and Sanctions Screening capabilities within a unified operational ecosystem.

The platform enables:

- centralized monitoring
- unified investigations
- shared governance
- centralized auditability
- consistent operational orchestration

1.3 Explainable Decisioning & Transparent Risk Scoring

Every alert, score contribution, screening match and operational decision generated by the platform is fully explainable and auditable.

The deterministic scoring framework provides:

- transparent risk visibility
- rule-by-rule explainability
- screening contribution traceability
- operational decision transparency
- governance traceability
- investigation accountability

while supporting regulatory expectations for explainability and auditability.

1.4 Business-Controlled Monitoring Framework

AFML enables operational teams to independently configure, modify and deploy monitoring logic through no-code configuration capabilities without dependency on software development activities.

The platform supports:

- no-code rule configuration
- operational workflow configuration
- sanctions screening configuration
- SLA and queue configuration
- scoring configuration
- governance parameter management

This approach significantly improves operational agility, reduces response time to emerging financial crime typologies and accelerates operational adaptation.

1.5 Real-Time, Near Real-Time & Post-Transaction Processing

AFML supports Real-Time (RT), Near Real-Time (NRT) and Post-Transaction (PT) monitoring capabilities within a single platform architecture.

This unified approach enables:

- consistent monitoring logic
- centralized operational governance
- unified investigation workflows
- reduced operational complexity
- centralized auditability

across the complete transaction lifecycle.

1.6 SLA-Driven Investigation Governance

The platform provides integrated SLA and queue governance capabilities enabling structured workload distribution, operational prioritization and investigation orchestration across enterprise financial crime operations.

The framework supports:

- configurable SLA models
- queue-based operational routing
- escalation orchestration
- calendar-aware calculations
- investigation prioritization
- governance transparency
- operational accountability

across Fraud Monitoring, AML Monitoring and Sanctions Screening workflows.

1.7 End-to-End Lifecycle Traceability

AFML provides complete operational traceability across:

- transaction monitoring
- alert generation
- sanctions screening
- investigation workflows
- operational escalations
- case management
- decisioning processes
- governance activities

ensuring comprehensive auditability, investigation transparency and operational accountability.

1.8 Modular, Scalable & Integration-Ready Architecture

The platform is designed using modular and scalable architecture principles enabling flexible deployment, independent component evolution and seamless integration with existing banking and payment ecosystems.

AFML supports:

- API-first integration
- event-driven processing
- scalable distributed architecture
- multi-rail interoperability
- ISO 20022 environments
- SWIFT infrastructures
- ISO 8583 card transaction ecosystems
- instant payment infrastructures

while maintaining operational resiliency and scalability.

1.9 Lightweight & Phased Deployment Approach

The modular platform design supports phased implementation, progressive onboarding and controlled operational rollout aligned with institutional operational readiness and governance requirements.

The implementation framework enables:

- domain-by-domain onboarding
- phased operational rollout
- controlled production enablement
- scalable enterprise deployment
- reduced implementation complexity
- accelerated operational adoption

across enterprise financial crime monitoring environments.

1.10 Future-Ready Enterprise Platform

AFML provides a scalable foundation for continuous platform evolution and future analytical enhancement.

The platform is designed to support:

- AI-assisted analytical capabilities
- advanced behavioral intelligence
- consortium intelligence integration
- intelligent operational orchestration

ensuring long-term operational scalability and adaptability to evolving financial crime risks and regulatory expectations.

PART IX — PRICING & LICENSING OVERVIEW

Pricing and licensing are defined based on the deployment model and functional scope of the implementation.

Typical models include:

- On-premise or cloud-based deployment options
- Module-based licensing aligned with enabled system capabilities
- User-based licensing based on assigned roles and access levels

Optional components, such as advanced analytics or future machine learning modules, may be provided as add-ons.

Note: general approach is not final, all pricing related agreements are done client agreement based.

Appendix

A. Glossary

RT (Real-Time): Immediate transaction processing, monitoring and operational decisioning during transaction execution.

NRT (Near Real-Time): Short-delay analytical processing and monitoring performed prior to transaction completion.

PT (Post-Transaction): Retrospective monitoring, investigation and analytical processing performed after transaction execution.

AML (Anti-Money Laundering): Regulatory and operational processes designed to detect, prevent and investigate money laundering activities.

CFT (Counter Financing of Terrorism): Monitoring and compliance processes designed to identify and prevent terrorist financing activities.

PEP (Politically Exposed Person): Customer classification representing individuals exposed to elevated corruption, bribery or financial crime risk due to public or political positions.

STR (Suspicious Transaction Report): Regulatory report submitted for transactions or activities identified as suspicious under applicable AML/CFT requirements.

MNR (Mandatory Notification Report): Regulatory report submitted for transactions meeting mandatory reporting thresholds or legal notification requirements.

SLA (Service Level Agreement): Configurable operational timelines and governance controls defining required processing and investigation timeframes for alerts and cases.

RBAC (Role-Based Access Control): Security and governance framework restricting user access and operational permissions based on assigned organizational roles and responsibilities.

UBO (Ultimate Beneficial Owner): Individual who ultimately owns, controls or benefits from a customer, legal entity or transaction relationship.

KYC (Know Your Customer): Customer identification, verification and risk assessment processes required for regulatory compliance and financial crime prevention.

RTP (Real-Time Payments): Payment infrastructures supporting immediate transaction processing and instant funds transfer capabilities.

© 2026 Copyright EGS. This document contains confidential information belonging to EGS not to be used by the receiver or reader herein for competitive purposes. Unauthorized disclosure, copying, distribution, or use of this information is strictly prohibited.

ISO 20022: International financial messaging standard used for structured payment, clearing and settlement communication.

ISO 8583: International messaging standard used for card authorization, ATM and card payment transaction processing environments.

SWIFT (Society for Worldwide Interbank Financial Telecommunication): Global financial messaging infrastructure supporting international payment and correspondent banking communication.

CNP (Card-Not-Present): Card transaction environment where the physical payment card is not directly presented during transaction processing.

B. Data Model Overview

The AFML platform utilizes a centralized and extensible enterprise data model designed to support Fraud Monitoring, AML Monitoring, Sanctions Screening, investigation workflows and operational governance across multiple banking and payment domains.

The data model supports structured storage, analytical processing, operational traceability and cross-channel correlation across transactions, alerts, investigations, behavioral indicators and operational activities.

The system data model includes:

- Customer & Counterparty Data
- Transaction & Payment Data
- Monitoring & Detection Data
- Investigation & Governance Data
- Regulatory & Reporting Data

The data architecture is designed to support scalability, operational resiliency, explainable decisioning and enterprise-level analytical visibility across high-volume financial crime monitoring environments

B. Supporting documentation:

The supporting documentation will be provided upon the integration.

AFML Technologies:

Deployment:

- Kubernetes
- Helm
- Docker containers

Data storage and streaming:

- PostgreSQL
- MongoDB
- Redis
- Kafka
- Ceph
- Secure encryption tools

Identity Provider:

- Keycloak

Monitoring:

- Grafana Loki
- Prometheus

Communication:

- RestAPI
- GraphQL
- gRPC
- Websocket
- JWT

Backend:

- Go
- Python
- Numpy
- Pandas
- FastAPI
- Strawberry
- TaskIQ

Frontend:

- TypeScript
- Angular
